

EventPass: Project Report

Overview

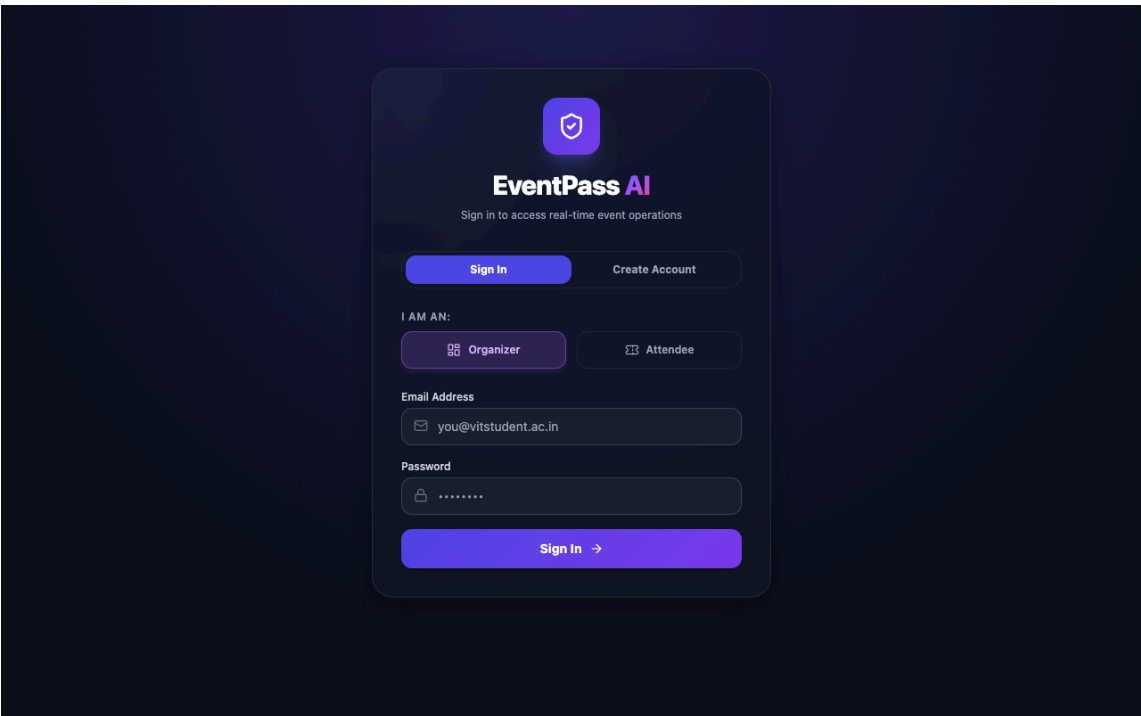

EventPass is a full-stack, real-time event registration and check-in platform. It is designed to handle secure ticket distribution, group registrations, and live capacity tracking. The platform operates on a robust architecture featuring a Node.js/Express backend with WebSockets and a modern React/Vite frontend.

Key Features

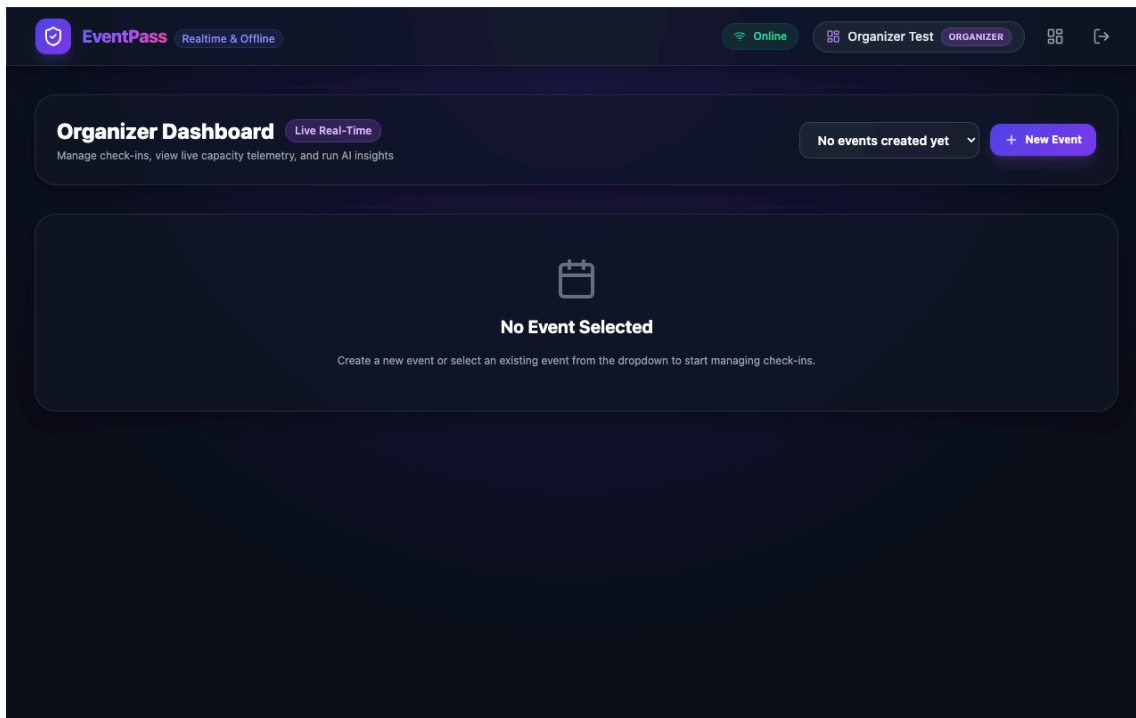

- **Dynamic TOTP QR Codes:** Anti-screenshot QR codes that refresh every 30 seconds to prevent ticket fraud.
- **Group Registrations:** Organizers can set minimum and maximum group sizes, and attendees can bulk-register their members.
- **Live Telemetry & Dashboard:** Real-time websocket updates push check-in stats directly to the Organizer dashboard.
- **Offline Mode Validation:** Check-in scanners continue to work locally and automatically flush sync queues to the server when connection is restored.
- **CSV Exports & Editing:** Organizers can update live events, set registration deadlines, and securely export attendee lists.
